

AMENDMENTS TO THE SPECIFICATION

In order to ~~form~~ define beam paths for relaying of a received communication signal to the destination terminals and for transmission of such signal back to the originator terminal, the relay terminal further includes a processor 50 that is adapted to derive directional-position data for the originator terminal and for the destination terminals to which immediate relay of a communication signal from the originator terminal is authorized. The directional-position data is derived prior to the detecting of the identification codes in the received signal by the signal processor 19. The derived directional-position data is utilized to command an adaptive antenna array 51 to ~~form~~ define beam paths for relaying the received communication signal to the destination terminals and for transmission of such signal back to the originator terminal.
